Guidelines for Safe Routine Dental Practice During the COVID-19 Pandemic

Perspectives from the Dental Training Department, Ministry of Health, Bahrain

ABSTRACT

The Dental Postgraduate Training Department at the Ministry of Health, Bahrain, is committed to raising the standards of care provided to our patients through postgraduate education, and the provision of evidence-based guidance for dental professionals.

We believe that this set of guidelines will prepare the dental professionals to resume and continue their routine dental procedures in primary care dental clinics during the pandemic.

The purpose of developing these guidelines is to ensure the provision of best practices in safe environment for the dental health care professionals and the patient.

INTRODUCTION

The purpose of developing these guidelines is to ensure the provision of best practices in safe environment for the dental health care professionals and the patient. It is a credit to our profession that we were able to work collaboratively and constructively to reach a consensus on this issue. We sincerely hope that there is equality in strictly adhering to this guideline, to ensure the delivery of dental treatment resuming routine dental health services. Bahrain has reported more than 15,000 cases of COVID-19 by June 2020 and it is on the rise. Dentists have been identified to be at high risk of infection and transmission due to the nature of their practice. Hence, the Ministry of Health in Bahrain temporarily suspended all aerosol generating and invasive dental procedures from March 2020, and only emergency and aerosol free dental procedures were available to address dental emergencies. Recently countries across the world, including Bahrain, are working on a roadmap to support reopening and safe functioning of their dental practices. The priority now remains safety, and this guide provides a framework for dental teams to ensure a risk assessment based strategy for safe treatment of patients at their practice level. In this document we propose that the dental practices across the World adhere to these guidelines to integrate safe and effective return to practice. As well as these guidelines will ensure safe and effective practice monitoring in the future, if a similar pandemic arises in the future in a safe environment and prevent further cross infection amongst the professionals and patients.

We hope that these guidelines will form a basis for further training of dental professionals and staff, which helps in effective practice monitoring. There is great deal of concern among dentists and dental practices regarding the transmission of various microbial diseases, due to close contact between the dentist and the patient. The recent pandemic of COVID-19 has created greater concern, and strict infection control guidelines must be in place before

TRANSMISSION ROUTES OF COVID-19 AND SIMILAR VIRAL INFECTIONS IN DENTAL PRACTICES:

The figure illustrates the possible transmission route of COVID-19 in dental practices. This can be applied to other previously reported infections like SARS (Severe Acute Respiratory Syndrome) and MERS (Middle Eastern Respiratory Syndrome) as well. The incubation period of most of these reported viral infections is reported to be around 2-14 days. This longer asymptomatic incubation period leads to transmission of the infection, which is often unnoticed. (Figure 1)

INFECTION CONTROL IN DENTAL PRACTICES:

The goal of a successful infection control program is to break the chain of infection (Figure 2) by consistently practicing protocols which would prevent the infectious agent moving from one host to another and preventing cross infection.

The infection control program should include:

• Rapid identification and source control of symptomatic patients (masking and separation)
• Strict adherence to respiratory and hand hygiene practices
• Training staff on correct use of PPE (Personal protective equipment)
• Rigorous environmental cleaning and disinfection of surfaces and equipment.

STANDARD OR UNIVERSAL PRECAUTIONS APPLIED AT THREE LEVELS:

Standard or Universal precautions are a set of infection control practices used to prevent transmission of diseases that can be acquired by contact with blood, body fluids, non-intact skin (including rashes), and mucous membranes. These measures are to be used when providing care to all individuals, whether or not they appear infectious or symptomatic. These guidelines emphasize the use of standard precautions in three levels as shown in Figure 3.

Level 1: Pre-treatment Precautions:
Visual Triage:

Visual triage includes the use of a checklist to perform initial screening of patients. This form given in Table 1 is developed by the National Taskforce for Combating the Coronavirus (COVID-19) in Bahrain, to evaluate the risk of exposure. This must be done prior to entry of the patient into the dental clinic, possibly in the waiting area. This has to be undertaken by trained dental staff that follow strict infection control guidelines involving the use of Personal protective equipment.

Pre-procedural Mouth rinses:

Aerosols are liquid or solid particles of less than 50 micrometers in diameter that stay suspended in the air for extended periods. Spatter are airborne particles larger than 50 mm in diameter that are too heavy to become suspended in the air for longer periods. This has a tendency to settle on surfaces \[^{4,5}\]. Many dental procedures, such as use of the ultrasonic scalers, slow- and high-speed hand pieces, and 3-way syringes, generate aerosol and spatter. There is evidence that dental aerosol can reach a distance of 1 through 3 meters from its source, causing contamination of distant surfaces. In contrast, spatter reaches shorter distances and settles quickly, which makes dental aerosol a greater concern for oral health care personnel (OHCP), when it comes to airborne contamination \[^{4,5,6-12}\]. Pre-procedural mouth rinses with chlorhexidine, which is readily available in all Primary care dental clinics, has been shown to significantly reduce the number of colony forming units (CFU) \[^{13}\]. The patient should rinse for a minimum of 30 seconds. \[^{13}\] Hence these guidelines advice the use of chlorhexidine as a pre-procedural mouth rinse for all patients before commencing dental treatment.

Water-line disinfection:

Dental unit waterlines are 3–4 m flexible, narrow tube made of plastic material. The surface of the tube enhances the biofilm formation. During the course of usage, the biofilm-coated untreated dental unit waterlines allows the microorganism to disperse through the water network and poses a risk to the dentist, dental team, and patients to pathogens. \[^{7}\] These guidelines suggest any of the combination of below mentioned techniques to prevent contamination through the waterlines.

- Flush waterlines with water for 3-5 minutes every morning before receiving your patient and the at end of the day.
- Flush hand pieces and waterlines for 20 to 30 seconds between patient appointments.
- Independent bottle water systems
- Anti-retraction devices to prevent backflow.

Additionally, dentists can choose the below mentioned techniques to further enhance disinfection of the water lines considering the current pandemic situation.

- Chemical treatment of water using Ethylenediaminetetraacetic acid, sodium hypochlorite, chlorhexidine gluconate, povidine iodine, ethanol, peroxide, phenol, and glutaraldehyde, that are tested in clinical trials \[^{5,7}\].
- The use of 10% sodium hypochlorite for 10 minutes flushing of the waterline has been recommended. \[^{7}\] However corrosive effects have been reported. So chemical treatment has to be used with caution.

Level 2: Precautions during treatment:

Hand hygiene:

The appropriate protocol should be adhered by both the patient and the dentist before commencing any procedure as shown in Figure 4. \[^{14}\]

Personal Protective Equipment (PPE):
Minimum level 3 surgical mask should be used\textsuperscript{[15]} N-95 to be used as a precaution when performing any aerosol generating procedure, or any procedure on a suspected or positive case of COVID-19 or CLI. The appropriate PPE to be used by OHCP is shown in Table 2.

**Importance of using Level 3 surgical mask:**

Masks are generally classified into 3 types: low (ASTM Level 1), moderate (ASTM level 2), and high barrier (ASTM Level 3) according to The American Society of Testing and Materials (ASTM).\textsuperscript{[13]} The classification by ASTM is presented in Table 3 with their suggestions for use. According to a study by The Centre for Evidence-Based Medicine, University of Oxford, there is no direct evidence on the utility of N-95 masks for prevention of transmission against COVID-19. However surgical masks level 3 performed similar to respirator masks for prevention against other viral infections.\textsuperscript{[16]} Hence these guidelines suggest the use of N-95 masks as a precaution when performing any aerosol generating procedure, or any procedure on a suspected or positive case of COVID-19 or CLI.

**Risk Stratification for Dental procedures:**

The classification by the FGDP (Faculty of General Dental Practice, UK) helps in stratification of risk of the dental procedure being undertaken, based on which, further selection and degree of infection control should be aimed. (Table 4)\textsuperscript{[17]} The guide is not an exhaustive list and only includes a few examples. Both low risk and high risk procedures should only be performed with appropriate level of infection control as discussed in detail above. If an AGP (aerosol generating procedure) is performed in a suspected patient, appointment interval should be lengthened. And every effort should be made to minimize overlapping dental appointments. The minimum suggested fallow time is 15 to 30 minutes.\textsuperscript{[17]}

**Sequence for putting on and removing PPE:**

The CDC guidelines for donning and doffing PPE should be strictly followed as shown in Figure 5 and Figure 6.\textsuperscript{[18]}

**Use of aerosol reducing devices:**

These guidelines propose the use of any of the below mentioned techniques to reduce the amount of aerosol generated during AGP’s, if it is necessary to be performed to avoid prescription misuse.

1. **Prevent contaminated aerosols from escaping the mouth** - Using rubber dam during AGPs will reduce the contamination of the aerosols with oral microbial organisms.\textsuperscript{[8]} Saliva ejectors reduce the aerosols escaping the mouth.\textsuperscript{[7,8]}
2. **Prevent contaminated aerosols from escaping the immediate operating site** - Aerosols coming out of the mouth are removed with local exhaust ventilation such as high-volume evacuation systems.\textsuperscript{[10]}
3. **General ventilation** - Methods such as avoiding the use of fans that can recirculate the air, to keep windows open at the dental operatory room and use of exhaust fans have been suggested.\textsuperscript{[10]}

**Level 3: Post treatment Precautions:**

After providing dental treatment for a patient it is imperative that correct procedures and protocols are followed to protect staff and all subsequent patients.

These guidelines recommend that:

- Patient should leave the operatory immediately and clean their hands outside the surgery
- Mask should not be removed by the dentist immediately, if an AGP was performed. Strictly adhere to the guidelines for doffing outside the dental operatory in the designated doffing area.
- Sterilization and disinfection protocols for the instruments and the whole operatory should be strictly followed and monitored regularly.
- Surfaces that cannot be properly pre-cleaned and disinfected must be protected with single use, disposable, barrier material such as plastic or fluid resistant paper. Barriers should be changed between patients.
- Disposable items are single use only items and must be disposed appropriately.

Waste Management:

Waste in the dental practice should be separated according to its category (medical or non-medical) at the point of generation. Bags and containers for medical waste should be appropriately color coded and labelled as biohazard or medical waste. Standard precautions mentioned above must be used when handling medical waste bags and containers. Medical waste bags and containers must not be overfilled and must not be compacted by hand. Medical waste and hazardous chemical waste (which includes some chemicals and mercury used in dental practice) must never be disposed of at local refuse tips that use compaction of an open landfill. Medical waste and sharps containers must be stored securely before collection by licensed waste contractors for final disposal using approved technologies by licensed/accredited contractors. Extracted teeth once cleaned of visible blood, debris, adherent soft tissues and saliva may be given to the patient. Alternatively, they can be wrapped in paper towel or placed in a disposable cup and covered with setting plaster before disposal in the general waste. The guidelines for waste management that is followed in the Ministry of Health in Bahrain is presented in Figure 7.

Figure 2: Chain of infection.
Figure 3: Standard precautions applied at three levels.

**Pre-treatment precautions**
- Visual triage of all patients attending dental clinic
- Pre-procedural mouthrinses
- Waterline disinfection

**Precautions during treatment**
- Use of appropriate PPE
- Hand Hygiene
- Risk stratification of dental procedures

**Post-treatment precautions**
- Disinfection of the clinics
- Sufficient time between patients
- Disposal of PPE and waste according to guidelines

Figure 4: Handwashing protocol

How to Handwash?
1. Wet hands with water.
2. Apply enough soap to cover all hand surfaces.
3. Rub hands palm to palm.
4. Rub hands palm to palm.
5. Rub hands palm to palm.
6. Rub hands palm to palm.
7. Rub hands palm to palm.
8. Rub hands palm to palm.
9. Rinse hands with water.
10. Use towel to turn off faucet.
11. Your hands are now safe.

How to Handrub?
1. Apply a barrier-free product in a cupped hand, covering all surfaces.
2. Rub hands palm to palm.
3. Rub hands palm to palm.
4. Rub hands palm to palm.
5. Rub hands palm to palm.
6. Rub hands palm to palm.
7. Rub hands palm to palm.
8. Rub hands palm to palm.
9. Rotate the use of left thumb distally in right palm and vice versa.
10. Rotate the use of left thumb distally in right palm and vice versa.
11. Dry hands thoroughly with a single-use towel.
12. Your hands are safe.
Figure 5: Sequence of putting on PPE

**SEQUENCE FOR PUTTING ON PERSONAL PROTECTIVE EQUIPMENT (PPE)**

The type of PPE used will vary based on the level of precautions required, such as standard and contact, droplet or airborne infection isolation precautions. The procedure for putting on and removing PPE should be tailored to the specific type of PPE.

1. **GOWN**
   - Fully cover torso from neck to knees, arms to end of wrists, and wrap around the back
   - Fasten in back of neck and waist

2. **MASK OR RESPIRATOR**
   - Secure ties or elastic bands at middle of head and neck
   - Fit flexible band to nose bridge
   - Fit snug to face and below chin
   - Fit-check respirator

3. **GOGGLES OR FACE SHIELD**
   - Place over face and eyes and adjust to fit

4. **GLOVES**
   - Extend to cover wrist of isolation gown

**USE SAFE WORK PRACTICES TO PROTECT YOURSELF AND LIMIT THE SPREAD OF CONTAMINATION**

- Keep hands away from face
- Limit surfaces touched
- Change gloves when torn or heavily contaminated
- Perform hand hygiene
Figure 6: Sequence to safely remove PPE
Figure 7: Medical waste segregation chart

- **Red Bag**
  a. Use to transport body parts, organs.
  b. Containers with blood/body fluids that cannot be emptied.
  c. All microbiological waste (specimens, cultures, and stocks of etiologic agents).
  d. Material used for patient care or used by staff (gowns, gloves, suction containers and catheters).
  e. Chemotherapy waste.

- **Yellow Bag**
  a. Used to dispose of infectious waste.
  b. Containers with blood/body fluids that cannot be emptied.

- **Black Bag**
  a. Used to dispose of general hospital waste.
  b. Items that would not release (drip) blood or other potentially infectious materials in a liquid or semi-liquid state.
  c. Laboratory solid waste, not included in the infectious waste category.

- **Sharp container**
  a. Used to dispose of needles, scalpels, pipettes, syringes, and glass items.
  b. Replace the sharps container promptly when the sharps container is ¾ filled (and reaches the fill line).

- **Dispose of municipality containers near the facility**
- **Store in Medical waste room to be collected for disposal**
- **Store in Medical waste room to be collected for disposal**
